SUMMARY

AI/ML Engineer with experience building end-to-end systems in NLP and computer vision. Comfortable working with messy data, real-world constraints, and systems that don't behave as expected. Focused on working on practical problems involving real-world data, system constraints, and automation.

SKILLS

Core: Machine Learning, NLP, Computer Vision, Data Pipelines, Model Optimization, System Design

Tech: Python, TensorFlow, Scikit-learn, YOLO, OpenCV, Selenium, Docker

Data: Pandas, NumPy, Feature Engineering, SMOTE, Data Annotation, NVIDIA DGX

EXPERIENCE

AI Intern

Jul 2024 – Aug 2024

Central Warehousing Corporation

New Delhi

- Reverse-engineered a multi-step warehouse management system to find automation opportunities in depositor registration workflows.
- Built a Selenium-based extraction pipeline using XPath and pixel targeting to handle dynamic and inconsistent UI elements.
- Built an NLP-based command interface to run end-to-end workflows, cutting manual processing time by around 60%.
- Adjusted the system to support partial automation due to captcha limitations, with fail-safe handling for edge cases.

AI/ML Trainee

2024

Global Infoventures

Ghaziabad

- Trained deep learning models on NVIDIA DGX A100, enabling faster experimentation and iteration.
- Built a YOLO-based object detection system from scratch: collected data, did manual annotation, trained and evaluated the model.
- Spent significant time debugging training failures caused by library version conflicts and GPU environment mismatches.
- Worked on production CV pipelines including PPE violation detection and multi-face recognition.

PROJECTS

Soil Health Restoration System (B.Tech Major Project)

- Built a crop recommendation system trained on 2,200 samples combining soil and environmental data.
- Added a bilingual interface so non-technical users (farmers) could use it without help.
- Iterated on the model to reduce sensitivity to key input features and stabilize predictions.

Fake News Detection System

- Handled class imbalance using SMOTE; combined TF-IDF with contextual signals to improve classification.
- Kept close tabs on data integrity to make sure synthetic samples didn't skew real-world distributions.

MoodSync – AI-Based Mood Analysis

- Built a system that converts emotional input into structured features and generates a continuous mood score.
- Added user behavior tracking to surface trends and give personalized suggestions over time.

ACHIEVEMENTS

- Filed 5 patents (1 granted) in AI and IoT systems.
- Published 6+ research papers across AI, cybersecurity, and IoT.
- Reviewer at CE2CT-2025 International Conference; gave an invited talk on AI and innovation.
